Re: [Position Title]

Dear Hiring Manager,

I'm a software engineer with 12 years of experience building and modernizing enterprise systems in BC post-secondary institutions — Vancouver Island University (2016–present) and Thompson Rivers University (2012–2016). I'm writing because this role aligns with what I do every day: design AI-powered solutions, automate manual processes, and integrate them with enterprise platforms.

AI and conversational AI are not abstract concepts for me — I build and ship them. I deployed a production AI chatbot at williamtucker.ca using the Anthropic Claude API directly via `@anthropic-ai/sdk` — custom system prompts, rate limiting, session management, Node.js/Express backend on Railway. I authored a custom Oracle MCP server in TypeScript that extends Claude Code with multi-database Oracle tooling (thick-mode LDAP, connection pooling, read/write guardrails), wired into my team's shared config — I build AI tooling, not just consume it. I shipped WTSAdmin, a full-stack SaaS (Next.js 16 + Supabase with Row-Level Security + Stripe + Resend), sole author, 4 days end-to-end. At VIU, I use AI agents (Claude, GPT-5) as a force multiplier on real modernization work — a 5-day end-to-end rebuild of a legacy Oracle room booking system as a .NET 8 Blazor Server app (sole author, currently in QA), and a ~7-week modernization of the Facilities Information System from Classic ASP to .NET 8 (now in production, adopted as the institutional reference). Planning, debugging, and design decisions stay with me; the tools accelerate the delivery.

I understand enterprise systems and integrations. I've spent a decade working with Oracle databases, SSO/SAML authentication, REST/SOAP API integrations, and the kind of legacy systems that organizations rely on. At

VIU, I built 9 REST API endpoints connecting an Oracle backend to a JavaScript front-end, designed CI/CD pipelines across 30+ repositories with automated health checks and rollback procedures, and implemented integrations between legacy systems and a modern cloud ERP.

I automate manual processes. I replaced a manual file submission workflow with a .NET web application featuring real-time progress (SignalR) and SSH/SFTP transfer. I transitioned an entire development team from server-based manual workflows to automated feature-branch development with CI/CD. I've automated compliance reporting, ETL pipelines, and deployment processes. When I see a manual, email-driven process, I see an automation opportunity — and I have the track record of delivering on it.

I hold a Computer Science diploma from Thompson Rivers University and a journeyman marine technician certification from BCIT, which gave me a "build things that have to work" engineering mindset that I carry into every project. Combined with 12 years of hands-on delivery, I bring both the technical depth and practical discipline this work demands.

I'm based in Kelowna and available for remote or hybrid work. I would welcome the chance to discuss how my experience maps to your needs.

Thank you for your consideration.

Sincerely, William Tucker
